

The elephant of the future

We are in Sartek in year 0. The air of the world is polluted and to go outside, I wear a mask because the air is not breathable.

A team created a new technology, a giant futuristic elephant created to fight pollution and help the world.

The team is called "Team Future" and I am in the team.

My name is Tarmak. I am twenty one years old and I am the best creator in this world but my work on the project is so big.

My capacity is limited but pollution is dangerous for the world.

My job is to help this world.

The elephant is bigger than the Eiffel Tower and it is driven by AI.

The goal of the elephant is to suck the polluted air thanks to its trunk and expel clean air for a better world than today.

Building an elephant is so long and when finished, the work starts. The AI is programmed for fast work and in two days, the air in the world is clean but "Team Future" is not acclaimed.

Then, the elephant goes to the Himalaya and stays at the top of the Everest in the meantime as it waits for work.

For the scientists, it is a big reward helping the world.

But all the people like the elephant, not the scientists.

THE NUCLEAR BATTERY

Hello, welcome ! Today we are in 2100 ! In our world, a new technology has been invented : everyone has their own nuclear fuel in a small cube.

This cube provides energy to homes, cars and objects (connected devices, electronic devices, etc...).

The nuclear battery is more efficient than electricity, and oil. A single cube is enough for 100 years in your house as it is capable of powering an entire house.

At 20 years old, a person receives his/her cube from the State.

This cube is smaller than a basket ball. It's not dangerous in terms of radiation and is clean (for humanity). It is connected to objects. The cube is very efficient. We don't use oil because it powers everything.

Pollution has disappeared because we don't use oil.

People are more comfortable and are safer.

There are more grass and trees than ever.

The sky is more blue in 2100 than in 2025.

There is no war, people are very happy.

This new technology is very important.
